Name

dumpobj — display OMF file contents.

Synopsis

dumpobj [options] *omf-file* [*segment_name ...*]

Description

dumpobj dumps header and opcode information from an OMF file. If segment names are specified, only those segments will be dumped. If no segment names are specified, all segments will be dumped.

Options

dumpobj recognizes the following options:

-d   Disassemble CODE and INIT segments. If specified twice (*i.e.* -dd), all segments will be disassembled.

-h   Display usage and version information.

-D   Do not do a hexdump of CONST, LCONST, or SUPER record data.

-H   Only the header information will be displayed.

Files

When disassembling data, **dumpobj** will attempt to interpret toolbox and GS/OS calls. To do so, it attempts to open files called "tools.txt" and "gsos.txt" located in /etc, /usr/etc, /usr/local/etc/, or the current directory.
